Every raster image format has its own advantages and disadvantages, including the following: JPEG: For a standard file format, JPEG is quick to edit, but may have a little too much compression, which can leave some edges jagged. GIF: For an easy-to-manipulate format, GIF may be a little less than optimum. However, you can get a more natural, hand-drawn look to images created in this format. TIFF: For Photoshop files, TIFF is the most common format for saving files. TIFF is not easy to manipulate, but it has many options. PSD: For Photoshop files, PSD is an extension used by Photoshop files. It makes it easier to save files and allows you to manipulate them easily. If you're opening Photoshop files from other programs, you may use these extensions to save your file. Can I get a computer for free? Q: Proof verification for an inequality of norms. I am trying to prove that if $\|u\| \leq \gamma \|v\|$ for all $v \in E$ and some $\gamma \in \mathbb{R}^+$, then there exist $\alpha \in \mathbb{R}^+$ such that $A = \alpha I_E$. I am stuck in the proof given by Rahn. Suppose there is $v \in E$ such that $\|u\| \leq \gamma \|v\|$ with $\gamma > 0$. We have $\|u\| \leq \gamma \|v\|$. Multiplying both sides of the inequality by γ , we have $\|u\| \leq \gamma^2 \|v\|$. Thus, $\|u\| = 1$. Since $\|u\| = 1$, it follows that $\|u\| = 1$. A: You can proceed as follows. Note that for $v \in E$, $\|u\| = \frac{\|u\|}{\|v\|} \|v\|$. It follows that $\|u\| \leq \gamma \|v\|$ for all $v \in E$, and A is continuous. We've all heard of failed open source projects, haven't we? Sure. The ones that were like "Open Source: The Next Great Computer Platform" in the early days of Linux's rise, but turned out to be, well, not quite the next great computer platform. I'm not talking about those projects that were released as open source but turned out to be rather nice proprietary software after all. I'm talking about, say, OpenOffice.org or OpenOffice.org and OpenOffice.org. We're talking about OpenOffice.org and OpenOffice.org and OpenOffice.org. That is the fate of many projects that begin under the open source banner. They may appear great, but it turns out that the number of other projects that have serious flaws (in some cases these flaws are fundamental) massively outweigh the number of perfectly functioning open source projects in the same space. Why is this? Not a lot of developers are working on open source software, only a tiny fraction of those have the time or inclination to pore through hundreds of mailing lists or list archives to see if there's already a patch. This isn't to say that a quality open source project can't be made, but you're far more likely to find this by accident than to find it intentionally. Don't get me wrong, there are some great open source projects out there. Off the top of my head, Notepad++, Sublime Text, the Eye of GNOME, Google Chrome and Ubuntu are just some of the projects I've found and used in the last year. In every one of those cases I knew about them and used them before I found them on the Internet. I'm still an avid user and contributor of these, so I'm not going to take a crack at starting an open source project and fail. But if you are going to take the leap into open source, make sure you've got a solid base to build from. OpenOffice.org and OpenOffice.org are merely two such examples. Find projects that aren't based on the name I spend a lot of time keeping track of the latest news in the Ruby on Rails community. I don't like to build software that isn't well supported.
